

NOTES for version 1.0:

- T1 is an HT7333 regulator and it's UNPOPULATED. It's input and output are shorted so the voltage is given by the battery through the diode D2.
- JP2 is UNPOPULATED for this version. This is an efficient switching voltage regulator module.
- C1's value should be 1000 uF. The current version has a 200uF equivalent capacitance because of price and availability reasons.
